

**Type list  
for the BMW/MINI ISOFIX base in conjunction with the  
Baby Seat 0+ or Junior Seat 1**

The fastening of the Baby Seat 0+ or Junior Seat 1 in the vehicle using the ISOFIX BASE for connection to the ISOFIX anchor points installed inside the car corresponds to the conditions of the "Semi-Universal" approval and is permitted in accordance with the European Standard for Child Restraint System (ECE R44/04).

Due to their approval, BMW child seats with the Isofix base are only suitable for vehicle seats that are equipped with Isofix anchor points (see also the explanations in your vehicle's owner's manual).

The weight class and ISOFIX height class for the Baby Seat 0+ in conjunction with the Isofix base is C, D and E.

The weight and height classes for the Junior Seat 1 in combination with the Isofix base are A, B and B1 (forwards-facing) and C and D (backwards-facing).

The type list offers a summary of the suitable seats in the individual vehicles and is constantly being added to. You can also call up the latest type list from our website at [www.bmw.com/childseats](http://www.bmw.com/childseats).

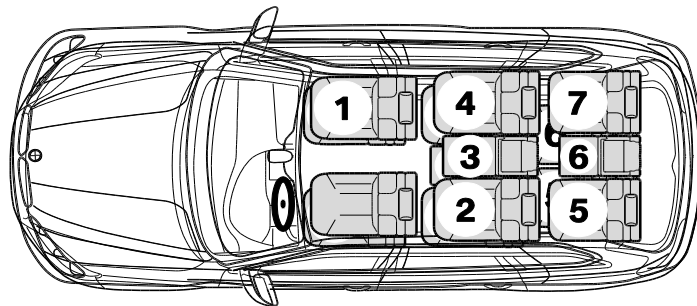

Please secure the ISOFIX BASE in the car at all times as described in the instructions for use. Also follow the instructions in your vehicle's owner's manual.

**CAUTION**

The Baby Seat 0+ and Junior Seat 1 must not be placed facing backwards on a passenger seat with activated passenger airbag. If the passenger airbag is disabled and the vehicle manufacturer has classified the passenger seat as suitable for the child car seat class (class 0+ or class 1), then you can use the Baby Seat 0+ or Junior Seat 1 on the passenger seat. When using the Baby Seat 0+ and Junior Seat 1 on the passenger seat, always follow the vehicle manufacturer's instructions

- For deactivating the passenger airbag
- To check that the passenger seat is classified as suitable
- And equipped with ISOFIX anchor points.

**a) Adjust the maximum support foot length on the ISOFIX BASE**
